TEXAS INSTRUMENTS

PCF8574 リモート 8 ビット I/O エクスパンダ、I2C バス対応

1 特長

- 低いスタンバイ消費電流：10µA 以下
- I2C からパラレル ポートへのエクスパンダ
- オープンドレイン割り込み出力
- ほとんどのマイクロコントローラと互換
- 大電流の駆動能力を持つラッチ付き出力により、LED を直接駆動
- JESD 78、Class II 準拠で 100mA 超のラッチアップ性能

2 アプリケーション

- テレコム シェルター：フィルタ ユニット
- サーバー
- ルーター (テレコム スイッチング機器)
- パーソナル コンピュータ
- パーソナル エレクトロニクス
- 産業用オートメーション
- GPIO が制限されたプロセッサを使用する製品

3 概要

この 2 線式双方向バス (I2C) 用 8 ビット入出力 (I/O) エクスパンダは、2.5V～6V の V_{CC} で動作するように設計されています。

PCF8574 デバイスは、I2C インターフェイス [シリアル クロック (SCL)、シリアル データ (SDA)] により、ほとんどのマイクロコントローラ ファミリの汎用リモート I/O 拡張に使用できます。

このデバイスには 8 ビット、疑似双方向の I/O ポート (P0～P7) があり、大電流駆動能力を持つラッチ付き出力により LED を直接駆動できます。それぞれの疑似双方向 I/O は、データ方向制御信号を使用せずに、入力または出力として使用できます。電源投入時、I/O は HIGH になります。このモードでは、V_{CC} への電流源のみがアクティブになります。

パッケージ情報

部品番号	パッケージ [1]	パッケージ サイズ[2]
PCF8574	TVSOP (DGV) (20)	5mm × 6.40 mm
	SOIC (DW、16)	10.3mm × 10.3mm
	PDIP (N、16)	19.3mm × 9.4 mm
	TSSOP (PW、20)	6.5mm × 6.4 mm
	VQFN (RGT、16)	3mm × 3mm
	VQFN (RGY) (20)	4.5mm × 3.5 mm

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

			MIN	MAX	UNIT
V_{CC}	Supply voltage range		−0.5	6.5	V
V_I	Input voltage range[2]		−0.5	V_{CC} + 0.5	V
V_O	Output voltage range[2]		−0.5	V_{CC} + 0.5	V
I_{IK}	Input clamp current	$V_I < 0$		−20	mA
I_{OK}	Output clamp current	$V_O < 0$		−20	mA
I_{OK}	Input/output clamp current	$V_O < 0$ or $V_O > V_{CC}$		±400	µA
I_{OL}	Continuous output low current	$V_O = 0$ to V_{CC}		50	mA
I_{OH}	Continuous output high current	$V_O = 0$ to V_{CC}		−4	mA
	Continuous current through V_{CC} or GND			±100	mA
T_J	Junction temperature			150	°C
T_{stg}	Storage temperature range		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Section 5.3 is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 [1]	1500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 [2]	2000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

5.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V_{CC}	Supply voltage	2.5	6	V
V_{IH}	High-level input voltage	$0.7 \times V_{CC}$	V_{CC} + 0.5	V
V_{IL}	Low-level input voltage	−0.5	$0.3 \times V_{CC}$	V
I_{OH}	High-level output current		−1	mA
I_{OL}	Low-level output current		25	mA
T_A	Operating free-air temperature	−40	85	°C

5.4 Thermal Information

THERMAL METRIC [1]		PCF8574						UNIT
		DGV	DW	N	PW	RGT	RGY	
		20 PINS	16 PINS	16 PINS	20 PINS	16 PINS	20 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	92	76.7	73.1	94.8	56.0	52.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	-	45.1	51.9	40.2	67.4	50.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	-	45.8	48.3	58.5	31.2	29.2	°C/W
ψ_{JT}	Junction-to-top characterization parameter	-	17.2	29.8	2.8	3.9	3.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	-	45.2	47.9	58.0	31.1	29.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	-	n/a	n/a	n/a	15.1	16.0	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC package thermal metrics application report.

5.5 Electrical Characteristics

over recommended operating free-air temperature range (unless otherwise noted)

		TEST CONDITIONS		VCC	MIN	TYP[1]	MAX	UNIT
V_{IK}	Input diode clamp voltage	$I_I = -18$ mA		2.5 V to 6 V	−1.2			V
V_{POR}	Power-on reset voltage	$V_I = V_{CC}$ or GND,	$I_O = 0$	6 V		1.3	2.4	V
I_{OH}	P port	V_O = GND		2.5 V to 6 V	-310		-30	µA
I_{OHT}	P port transient pullup current	High during acknowledge, V_{OH} = GND		2.5 V		−1		mA
I_{OL}	SDA	$V_O = 0.4$ V		2.5 V to 6 V	3			mA
	P port	$V_O = 1$ V		5 V	10	25		
	$\overline{INT}$	$V_O = 0.4$ V		2.5 V to 6 V	1.6			
I_I	SCL, SDA	$V_I = V_{CC}$ or GND		2.5 V to 6 V			±5	µA
	$\overline{INT}$						±5	
	A0, A1, A2						±5	
I_{IHL}	P port	-250mV < Vi < GND		2.5 V to 6 V			±400	µA
I_{CC}	Operating mode	$V_I = V_{CC}$ or GND,	$I_O = 0$,	$f_{SCL} = 100$ kHz	6 V		40	100	µA
	Standby mode	$V_I = V_{CC}$ or GND,	$I_O = 0$			2.5	10	
C_i	SCL	$V_I = V_{CC}$ or GND		2.5 V to 6 V		1.5	7	pF
C_{io}	SDA	$V_{IO} = V_{CC}$ or GND		2.5 V to 6 V		3	7	pF
	P port					4	10	

(1)   All typical values are at V_{CC} = 5 V, T_A = 25°C.

5.6 I²C Interface Timing Requirements

over recommended operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
f_{scl}	I²C clock frequency			100	kHz
t_{sch}	I²C clock high time		4		µs
t_{scl}	I²C clock low time		4.7		µs
t_{sp}	I²C spike time			70	ns
t_{sds}	I²C serial data setup time		250		ns
t_{sdh}	I²C serial data hold time		0		ns
t_{icr}	I²C input rise time			1	µs
t_{icf}	I²C input fall time			0.3	µs
t_{ocf}	I²C output fall time (10-pF to 400-pF bus)			300	ns
t_{buf}	I²C bus free time between stop and start		4.7		µs
t_{sts}	I²C start or repeated start condition setup		4.7		µs
t_{sth}	I²C start or repeated start condition hold		4		µs
t_{sps}	I²C stop condition setup		4		µs
t_{vd}	Valid data time	SCL low to SDA output valid		3.4	µs
C_b	I²C bus capacitive load			400	pF

7 Detailed Description

7.1 Overview

The PCF8574 device is an 8-bit I/O expander for the two-line bidirectional bus (I2C) is designed for 2.5-V to 6-V V_{CC} operation. It provides general-purpose remote I/O expansion for most micro-controller families via the I2C interface (serial clock, SCL, and serial data, SDA, pins).

The PCF8574 device provides an open-drain output ($\overline{INT}$) that can be connected to the interrupt input of a microcontroller. An interrupt is generated by any rising or falling edge of the port inputs in the input mode. After time, t_{iv}, $\overline{INT}$ is valid. Resetting and reactivating the interrupt circuit is achieved when data on the port is changed to the original setting or data is read from, or written to, the port that generated the interrupt. Resetting occurs in the read mode at the acknowledge bit after the rising edge of the SCL signal, or in the write mode at the acknowledge bit after the high-to-low transition of the SCL signal. Interrupts that occur during the acknowledge clock pulse can be lost (or be very short) due to the resetting of the interrupt during this pulse. Each change of the I/Os after resetting is detected and, after the next rising clock edge, is transmitted as $\overline{INT}$. Reading from, or writing to, another device does not affect the interrupt circuit. This device does not have internal configuration or status registers. Instead, read or write to the device I/Os directly after sending the device address (see 図 7-3 and 図 7-4).

By sending an interrupt signal on this line, the remote I/O can inform the microcontroller if there is incoming data on its ports without having to communicate by way of the I^{2}C bus. Therefore, PCF8574 can remain a simple target device.

An additional strong pullup to V_{CC} allows fast rising edges into heavily loaded outputs. This device turns on when an output is written high and is switched off by the negative edge of SCL. The I/Os should be high before being used as inputs.

7.2 Functional Block Diagram
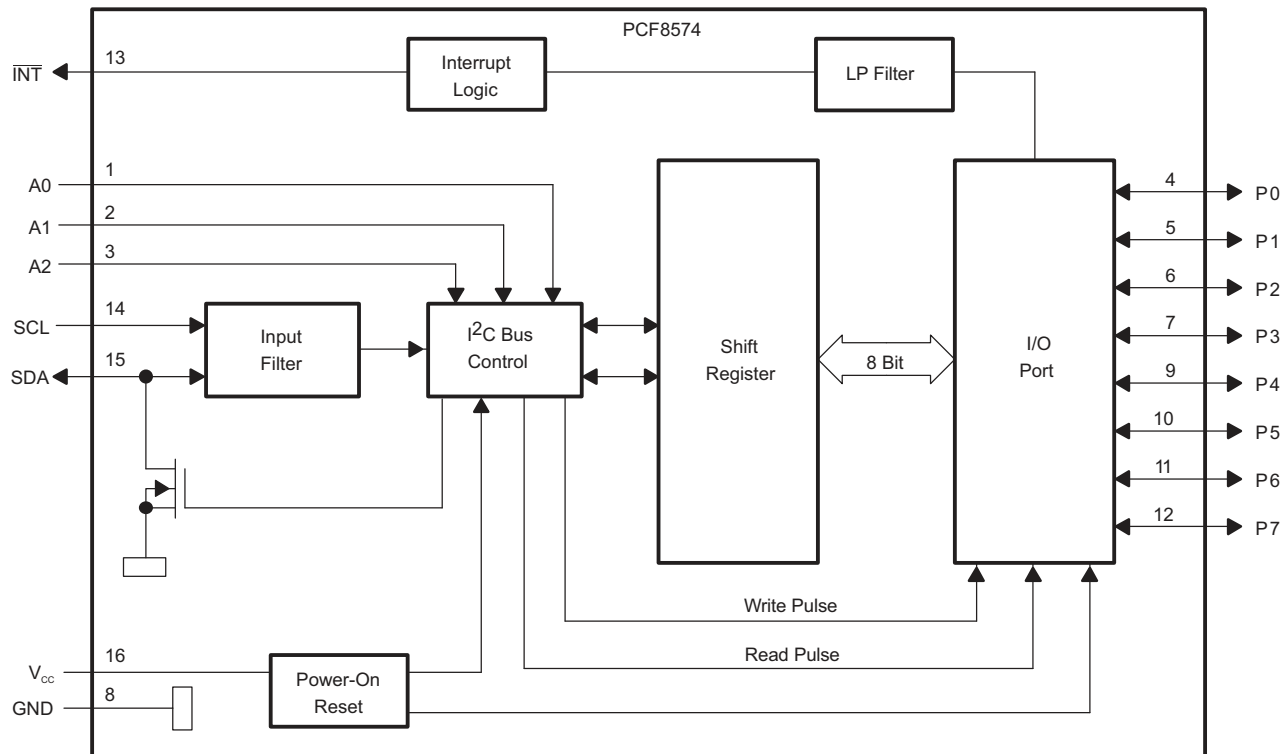

Pin numbers shown are for the DW and N packages.

7.3 Feature Description

7.3.1 I^2C Interface

I^2C communication with this device is initiated by a controller sending a start condition, a high-to-low transition on the SDA I/O while the SCL input is high. After the start condition, the device address byte is sent, most-significant bit (MSB) first, including the data direction bit (R/$\overline{W}$). This device does not respond to the general call address. After receiving the valid address byte, this device responds with an acknowledge, a low on the SDA I/O during the high of the acknowledge-related clock pulse. The address inputs (A0–A2) of the target device must not be changed between the start and the stop conditions.

The data byte follows the address acknowledge. If the R/$\overline{W}$ bit is high, the data from this device are the values read from the P port. If the R/$\overline{W}$ bit is low, the data are from the controller, to be output to the P port. The data byte is followed by an acknowledge sent from this device. If other data bytes are sent from the controller, following the acknowledge, they are ignored by this device. Data are output only if complete bytes are received and acknowledged. The output data will be valid at time, t_{pv}, after the low-to-high transition of SCL and during the clock cycle for the acknowledge.

A stop condition, which is a low-to-high transition on the SDA I/O while the SCL input is high, is sent by the controller.
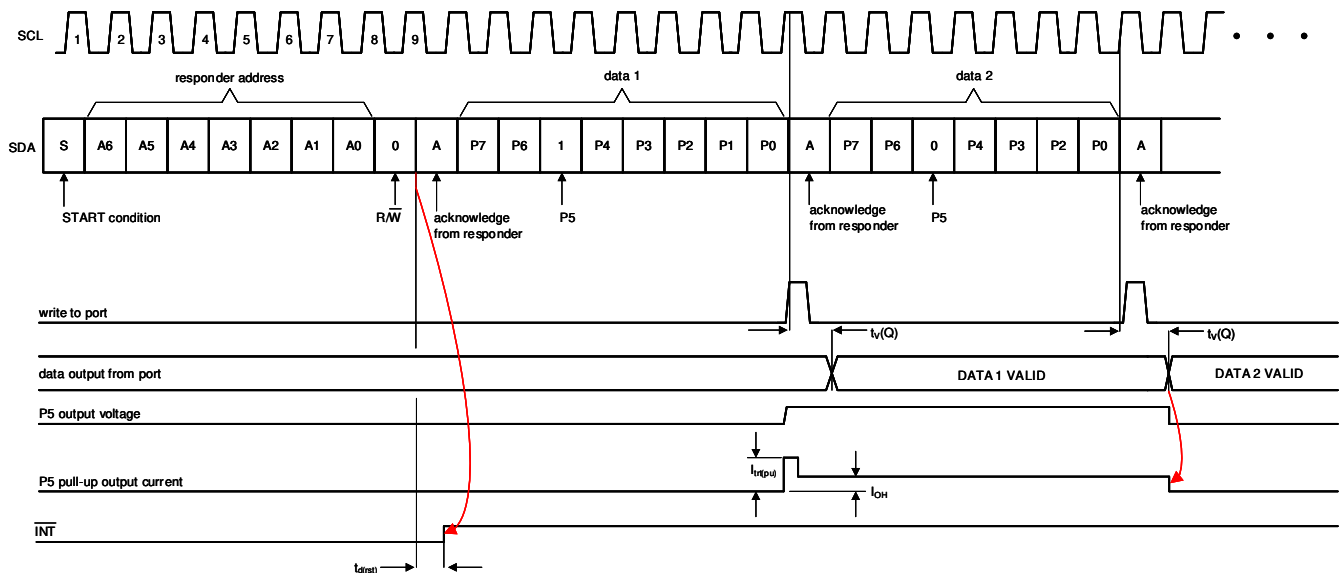

7.3.2 Interface Definition

BYTE	BIT							
	7 (MSB)	6	5	4	3	2	1	0 (LSB)

7.4 Device Functional Modes

図 7-3 and 図 7-4 show the address and timing diagrams for the write and read modes, respectively.

図 7-3. Write Mode (Output)

Product Folder Links: *PCF8574*

English Data Sheet: SCPS068

図 7-4. Read Mode (Input)
A. A low-to-high transition of SDA while SCL is high is defined as the stop condition (P). The transfer of data can be stopped at any moment bya stop condition. When this occurs, data present at the latest ACK phase is valid (output mode). Input data is lost.

8 Application and Implementation

8.1 Application Information
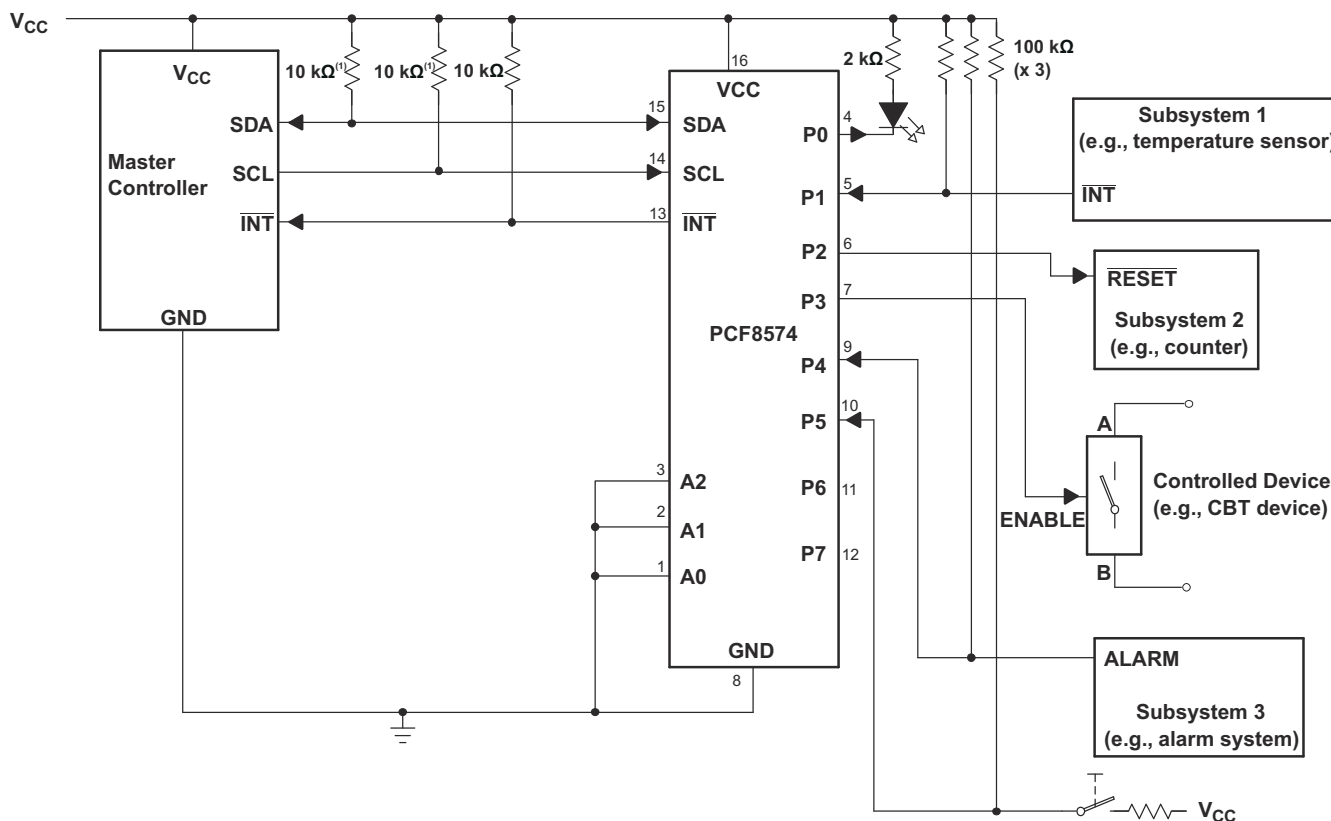

図 8-1 shows an application in which the PCF8574 device can be used.

8.2 Typical Application

A. The SCL and SDA pins must be tied directly to V_{CC} because if SCL and SDA are tied to an auxiliary power supply that could be powered on while V_{CC} is powered off, then the supply current, ICC, will increase as a result.
B. Device address is configured as 0100000 for this example.
C. P0, P2, and P3 are configured as outputs.
D. P1, P4, and P5 are configured as inputs.
E. P6 and P7 are not used and must be configured as outputs.

図 8-1. Application Schematic

8.2.1 Design Requirements

8.2.1.1 Minimizing I_{CC} When I/Os Control LEDs

When the I/Os are used to control LEDs, normally they are connected to V_{CC} through a resistor as shown in 図 8-1. For a P-port configured as an input, I_{CC} increases as V_I becomes lower than V_{CC}. The LED is a diode, with threshold voltage V_T, and when a P-port is configured as an input the LED will be off but V_I is a V_T drop below V_{CC}.

For battery-powered applications, it is essential that the voltage of P-ports controlling LEDs is greater than or equal to V_{CC} when the P-ports are configured as input to minimize current consumption. 図 8-2 shows a high-value resistor in parallel with the LED. 図 8-3 shows V_{CC} less than the LED supply voltage by at least V_T. Both of these methods maintain the I/O V_I at or above V_{CC} and prevents additional supply current consumption when the P-port is configured as an input and the LED is off.

図 8-2. High-Value Resistor in Parallel With LED

図 8-3. Device Supplied by a Lower Voltage

8.2.2 Detailed Design Procedure

The pull-up resistors, R_P, for the SCL and SDA lines need to be selected appropriately and take into consideration the total capacitance of all targets on the I^{2}C bus. The minimum pull-up resistance is a function of V_{CC}, $V_{OL,(max)}$, and I_{OL}:
$$R_{p(min)} = \frac{V_{CC} - V_{OL(max)}}{I_{OL}}$$

(1)

The maximum pull-up resistance is a function of the maximum rise time, t_r (300 ns for fast-mode operation, f_{SCL} = 400 kHz) and bus capacitance, C_b:

$$R_{p(max)} = \frac{t_r}{0.8473 \times C_b}$$

(2)

The maximum bus capacitance for an I^{2}C bus must not exceed 400 pF for standard-mode or fast-mode operation. The bus capacitance can be approximated by adding the capacitance of the PCF8574 device, C_i for SCL or C_{io} for SDA, the capacitance of wires/connections/traces, and the capacitance of additional targets on the bus.

8.2.3 Application Curves

Standard-mode (f_{SCL}= 100 kHz, t_r = 1 µs)   Fast-mode (f_{SCL}= 400 kHz, t_r= 300 ns)

図 8-4. Maximum Pull-Up resistance ($R_{p(max)}$) vs Bus Capacitance (C_b)

V_{OL} = 0.2*V_{CC}, I_{OL} = 2 mA when V_{CC} ≤ 2 V
V_{OL} = 0.4 V, I_{OL} = 3 mA when V_{CC} > 2 V

図 8-5. Minimum Pull-Up Resistance ($R_{p(min)}$) vs Pull-Up Reference Voltage (V_{CC})

8.3 Power Supply Recommendations

8.3.1 Power-On Reset Requirements

In the event of a glitch or data corruption, the PCF8574 device can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

The two types of power-on reset are shown in 図 8-6 and 図 8-7.

Product Folder Links: *PCF8574*

English Data Sheet: *SCPS068*

図 8-6. V_{CC} is Lowered Below 0.2 V or 0 V and Then Ramped Up to V_{CC}

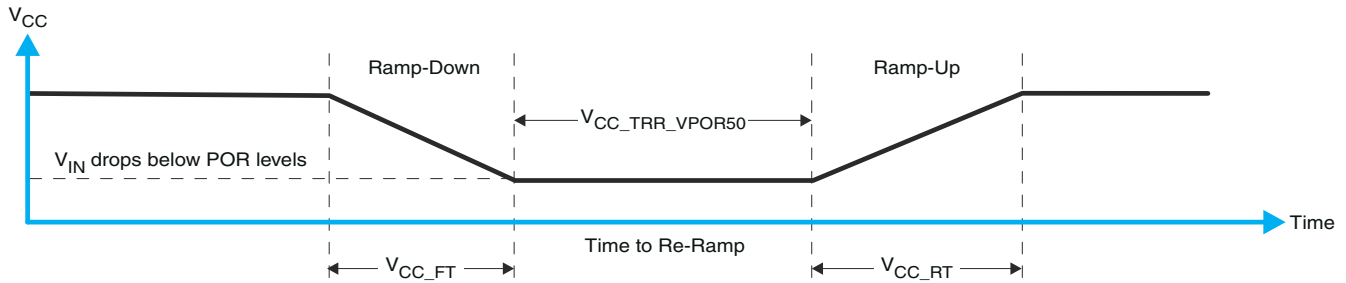

図 8-7. V_{CC} is Lowered Below the POR Threshold, Then Ramped Back Up to V_{CC}

表 8-1 specifies the performance of the power-on reset feature for PCF8574 for both types of power-on reset.

表 8-1. Recommended Supply Sequencing and Ramp Rates [1]

PARAMETER			MIN	TYP	MAX	UNIT
V_{CC_FT}	Fall rate	See 図 8-6	1		100	ms
V_{CC_RT}	Rise rate	See 図 8-6	0.01		100	ms
$V_{CC\_TRR\_GND}$	Time to re-ramp (when V_{CC} drops to GND)	See 図 8-6	0.001			ms
$V_{CC\_TRR\_POR50}$	Time to re-ramp (when V_{CC} drops to V_{POR_MIN} – 50 mV)	See 図 8-7	0.001			ms
V_{CC_GH}	Level that V_{CCP} can glitch down to, but not cause a functional disruption when V_{CCX_GW} = 1 μs	See 図 8-8			1.2	V
V_{CC_GW}	Glitch width that will not cause a functional disruption when V_{CCX_GH} = 0.5 × V_{CCx}	See 図 8-8				μs
V_{PORF}	Voltage trip point of POR on falling V_{CC}			0.99	1.28	V
V_{PORR}	Voltage trip point of POR on fising V_{CC}			1.190	1.410	V

(1) T_A = –40°C to 85°C (unless otherwise noted)

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (V_{CC_GW}) and height (V_{CC_GH}) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. 図 8-8 and 表 8-1 provide more information on how to measure these specifications.

図 8-8. Glitch Width and Glitch Height

V_{POR} is critical to the power-on reset. V_{POR} is the voltage level at which the reset condition is released and all the registers and the I^{2}C/SMBus state machine are initialized to their default states. The value of V_{POR} differs based on the V_{CC} being lowered to or from 0. 図 8-9 and 表 8-1 provide more details on this specification.

図 8-9. V$_{POR}$

8.4 Layout

8.4.1 Layout Guidelines

For printed circuit board (PCB) layout of the PCF8574 device, common PCB layout practices should be followed but additional concerns related to high-speed data transfer such as matched impedances and differential pairs are not a concern for I2C signal speeds.

In all PCB layouts, it is a best practice to avoid right angles in signal traces, to fan out signal traces away from each other upon leaving the vicinity of an integrated circuit (IC), and to use thicker trace widths to carry higher amounts of current that commonly pass through power and ground traces. By-pass and de-coupling capacitors are commonly used to control the voltage on the VCC pin, using a larger capacitor to provide additional power in the event of a short power supply glitch and a smaller capacitor to filter out high-frequency ripple. These capacitors should be placed as close to the PCF8574 device as possible. These best practices are shown in 図 8-10.

For the layout example provided in 図 8-10, it would be possible to fabricate a PCB with only 2 layers by using the top layer for signal routing and the bottom layer as a split plane for power (VCC) and ground (GND). However, a 4 layer board is preferable for boards with higher density signal routing. On a 4 layer PCB, it is common to route signals on the top and bottom layer, dedicate one internal layer to a ground plane, and dedicate the other internal layer to a power plane. In a board layout using planes or split planes for power and ground, vias are placed directly next to the surface mount component pad which needs to attach to VCC or GND and the via is connected electrically to the internal layer or the other side of the board. Vias are also used when a signal trace needs to be routed to the opposite side of the board, but this technique is not demonstrated in 図 8-10.

9.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser based versions of this data sheet, refer to the left hand navigation.

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
